

Chart Parsing

Lecture #6

Introduction to Natural Language Processing

CMPSCI 585, Fall 2007

University of Massachusetts Amherst

Andrew McCallum

(agglomeration of slides from Jason Eisner)

Today's Main Points

- Hand back In-class Exercise #2
- Apologies: HW #1 not completed by grader. I'm giving you an extra day; now due Friday.
- Motivations and applications of Parsing.
- Dynamic Programming for Parsing: CYK
 - Some hands-on practice
- Discuss Programming Assignment #3
“Implement CYK and build a grammar”

Programming languages

```
printf ("/charset [%s",
        (re_opcode_t) *(p - 1) == charset_not ? "^" : "");
assert (p + *p < pend);
for (c = 0; c < 256; c++)
  if (c / 8 < *p && (p[1 + (c/8)] & (1 << (c % 8)))) {
    /* Are we starting a range? */
    if (last + 1 == c && ! inrange) {
      putchar ('-');
      inrange = 1;
    }
    /* Have we broken a range? */
    else if (last + 1 != c && inrange) {
      putchar (last);
      inrange = 0;
    }
    if (! inrange)
      putchar (c);
    last = c;
  }
```

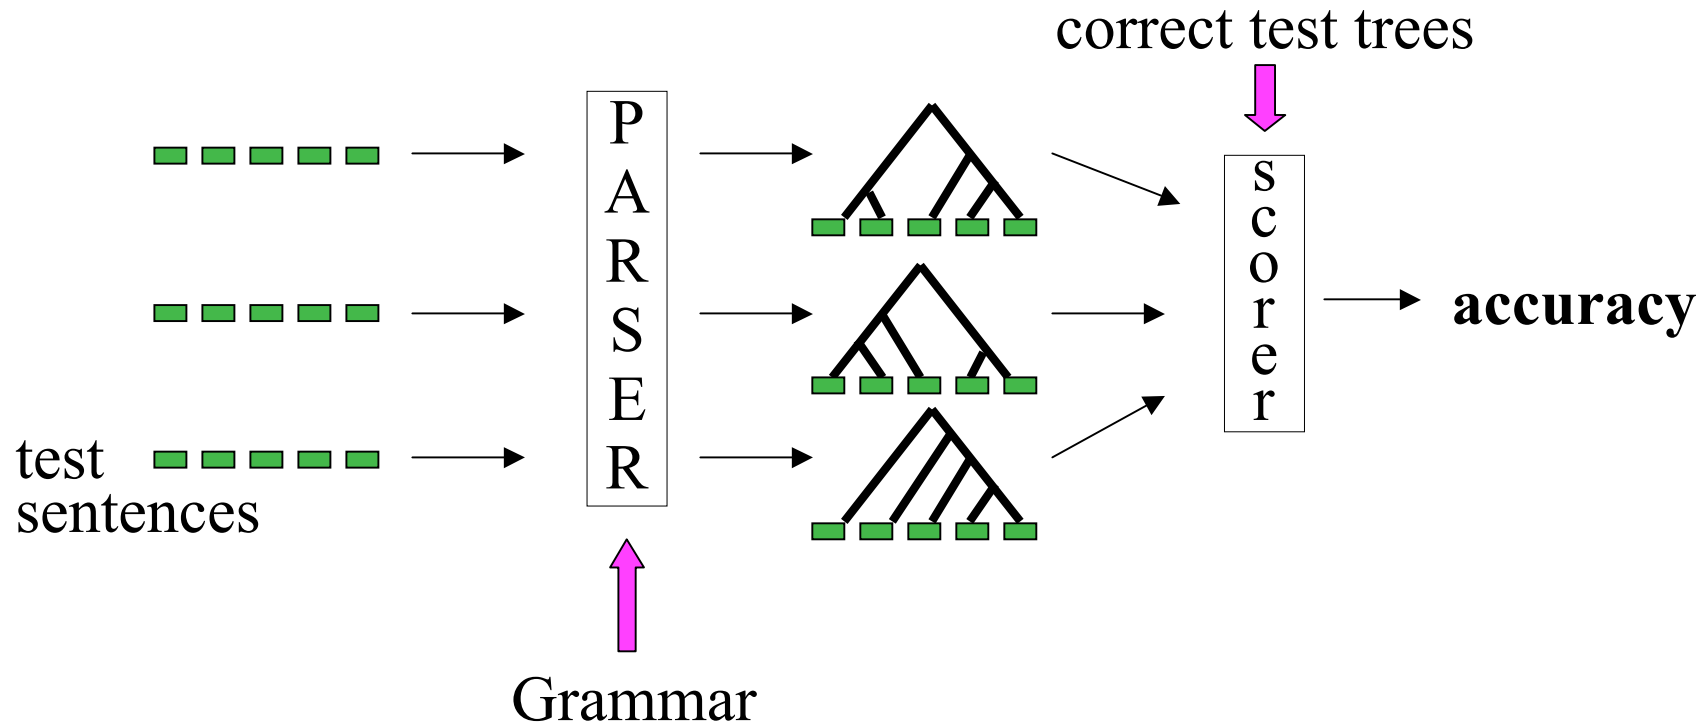

- Easy to parse.
- Designed that way!

Natural languages

```
printf "/charset %s", re opcode t *p - 1 == charset not ? "^" : "";
assert p + *p < pend; for c = 0; c < 256; c++ if c / 8 < *p && p1 + c/8
& 1 << c % 8 Are we starting a range? if last + 1 == c && ! inrange
putchar '-'; inrange = 1; Have we broken a range? else if last + 1 != c
&& inrange putchar last; inrange = 0; if ! inrange putchar c; last =
c;
```

- No { } () [] to indicate scope & precedence
- Lots of overloading (arity varies)
- Grammar isn't known in advance!
- Context-free grammar not best formalism

The parsing problem

Applications of parsing (1/2)

- Machine translation (Alshawi 1996, Wu 1997, ...)

- Speech synthesis from parses (Prevost 1996)
 - The government plans to raise income tax.
 - The government plans to raise income tax the imagination.
- Speech recognition using parsing (Chelba et al 1998)
 - Put the file in the folder.
 - Put the file and the folder.

Applications of parsing (2/2)

- Grammar checking (Microsoft)
- Indexing for information retrieval (Woods 1997)
... washing a car with a hose ... vehicle maintenance
- Information extraction (Hobbs 1996) (Miller et al 2000)

Parsing State of the Art

- Recent parsers quite accurate, e.g.,
 - *A Maximum-Entropy-Inspired Parser*
Eugene Charniak
Proceedings of NAACL-2000.
 - *Three Generative, Lexicalised Models for Statistical Parsing*
Michael Collins
Proceedings of ACL, 1997.
- Most sentences parsed correctly, or with one error

Last class...

- We defined a CFG,
where it sits in the Chomsky hierarchy
- Talked about parsing as ***search***...
...through an exponential number of possible trees
- Gave examples of bottom-up and top-down search.
- Discussed problems:
 - Infinite loop with left-recursive rules
 - Much duplicated work in exponential space... backtracking

Dynamic Programming for Parsing

- Given CFG in Chomsky Normal Form, and an input string, we want to search for valid parse trees.
- What are the intermediate sub-problems?
- What would the dynamic programming table look like?

CKY algorithm, recognizer version

- **Input:** string of n words
- **Output:** yes/no (since it's only a recognizer)
- **Data structure:** $n \times n$ table
 - rows labeled 0 to $n-1$
 - columns labeled 1 to n
 - cell $[i,j]$ lists possible constituents spanning words between i and j

CKY algorithm, recognizer version

- **for** $i := 1$ to n
 - Add to $[i-1, i]$ all (part-of-speech) categories for the i^{th} word
- **for** width $:= 2$ to n
 - **for** start $:= 0$ to n -width
 - Define end $:=$ start + width
 - **for** mid $:=$ start+1 to end-1
 - **for** every constituent X in [start, mid]
 - **for** every constituent Y in [mid, end]
 - **for** all ways of combining X and Y (if any)
 - Add the resulting constituent to [start, end] ~~if it's not already there.~~

CMPSCI 585 In-class Exercise #3 Name: _____ Student ID: _____

Fill in the CYK dynamic programming table to parse the sentence below. In the bottom right corner, draw the two parse trees.

| | | | | | |
|---|-----|------|------|------|-----------------|
| | she | eats | fish | with | chop- sticks |
| 0 | 1 | 2 | 3 | 4 | 5 |
| 0 | NP | | | | |
| 1 | | | | | |
| 2 | | | | | |
| 3 | | | | | |
| 4 | | | | | |

$S \rightarrow NP VP$
 $NP \rightarrow NP PP$
 $VP \rightarrow V NP$
 $VP \rightarrow VP PP$
 $PP \rightarrow P NP$

$NP \rightarrow she$
 $NP \rightarrow fish$
 $NP \rightarrow fork$
 $NP \rightarrow chopsticks$
 $V \rightarrow eats$
 $V \rightarrow fish$
 $P \rightarrow with$

CMPSCI 591N In-class Exercise #3

Name: _____ Student ID: _____

Fill in the CYK dynamic programming table to parse the sentence below. In the bottom right corner, draw the two parse trees.

| | | | | | |
|---|-----|------|--------------------|------|---|
| | she | eats | fish | with | chopsticks |
| 0 | 1 | 2 | 3 | 4 | 5 |
| 0 | NP | | S _{NP,VP} | | S _{NP VP} S _{NP VP} |
| 1 | | V | VP _{V NP} | | VP _{V NP} VP _{VP PP} |
| 2 | | | NP V | | NP _{NP PP} |
| 3 | | | | P | PP _{P NP} |
| 4 | | | | | NP |

- S → NP VP
- NP → NP PP
- VP → V NP
- VP → VP PP
- PP → P NP

- NP → she
- NP → fish
- NP → fork
- NP → chopsticks
- V → eats
- V → fish
- P → with

Homework #3

- Implement CYK
- Create a grammar
- Experiment with it...

- Due Thursday.

Dynamic Programming Parsing 2

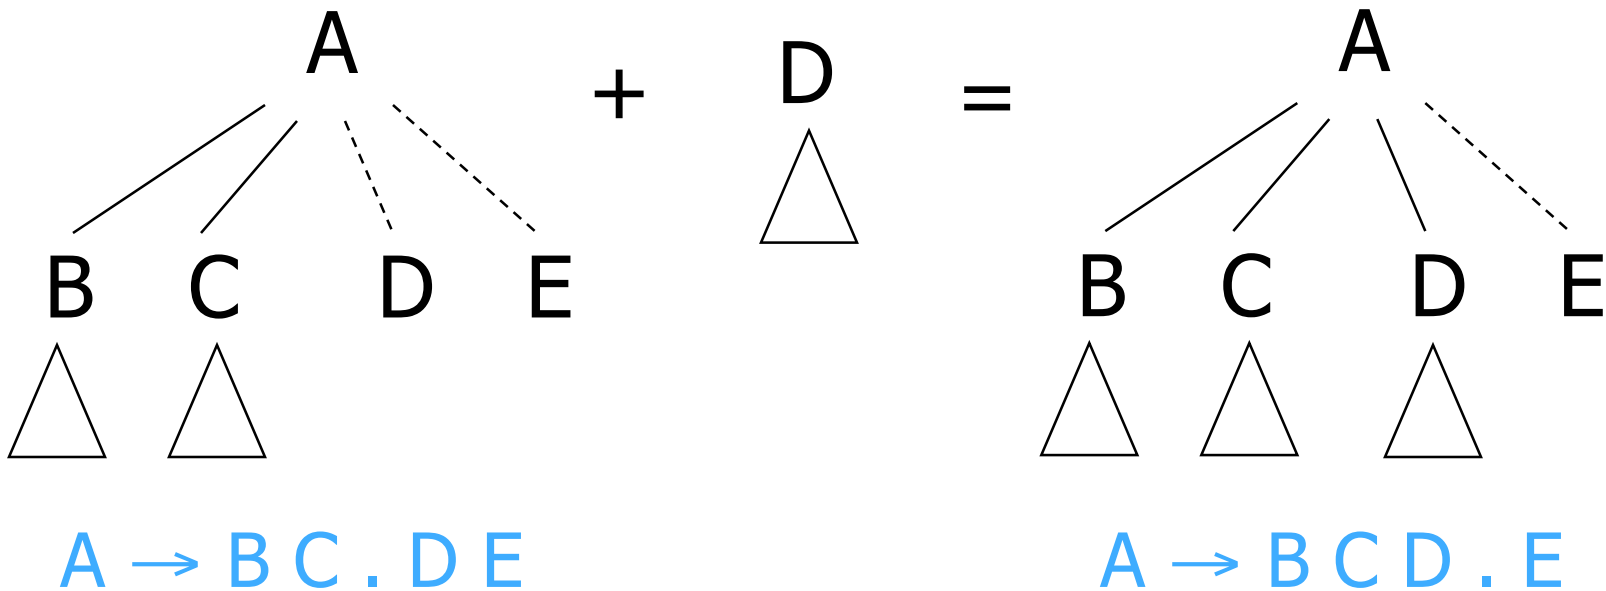

- How about a dynamic programming solution for **arbitrary CGF grammars**?
- (Grammars not in Chomsky Normal Form.)

Earley Parser (1970)

- Nice combination of
 - dynamic programming
 - incremental interpretation
 - avoids infinite loops
 - no restrictions on the form of the context-free grammar.
 $A \rightarrow B C \textit{ the D of}$ causes no problems
 - $O(n^3)$ worst case, but faster for many grammars
 - Uses left context and optionally right context to constrain search.

Overview of the Algorithm

- Finds constituents and partial constituents in input
 - $A \rightarrow B C . D E$ is partial: only the first half of the A

Overview of the Algorithm

- Proceeds incrementally left-to-right
 - Before it reads word 5, it has already built all hypotheses that are consistent with first 4 words
 - Reads word 5 & attaches it to immediately preceding hypotheses. Might yield new constituents that are then attached to hypotheses immediately preceding *them* ...
 - E.g., attaching **D** to **A → B C . D E** gives **A → B C D . E**
 - Attaching **E** to that gives **A → B C D E .**
 - Now we have a complete **A** that we can attach to hypotheses immediately preceding the **A**, etc.

The Parse Table

- Columns 0 through n corresponding to the gaps between words
- Entries in column 5 look like (3, NP → NP . PP)
 - (but we'll omit the → etc. to save space)
 - Built while processing word 5
 - Means that the input substring from 3 to 5 matches the initial NP portion of a NP → NP PP rule
 - Dot shows how much we've matched as of column 5
 - Perfectly fine to have entries like (3, VP → is it . true that S)

The Parse Table

- Entries in column 5 look like (3, NP → NP . PP)
- What will it mean that we have this entry?
 - *Unknown right context: Doesn't* mean we'll necessarily be able to find a VP starting at column 5 to complete the S.
 - *Known left context: Does* mean that some dotted rule back in column 3 is looking for an S that starts at 3.
 - So if we actually do find a VP starting at column 5, allowing us to complete the S, then we'll be able to attach the S to something.
 - And when that something is complete, it too will have a customer to *its* left ...
 - In short, a top-down (i.e., goal-directed) parser: it chooses to start building a constituent not because of the input but because that's what the left context needs. In **the spoon**, won't build **spoon** as a verb because there's no way to use a verb there.
 - So any hypothesis in column 5 *could* get used in the correct parse, if words 1-5 are continued in just the right way by words 6-n.

Earley's Algorithm, recognizer version

- Add **ROOT** \rightarrow **. S** to column 0.
- For each j from 0 to n :
 - For each dotted rule in column j , (including those we add as we go!) look at what's after the dot:
 - If it's a word w , SCAN:
 - If w matches the input word between j and $j+1$, advance the dot and add the resulting rule to column $j+1$
 - If it's a non-terminal X , PREDICT:
 - Add all rules for X to the bottom of column j , with the dot at the start: e.g. **X** \rightarrow **. Y Z**
 - If there's nothing after the dot, ATTACH:
 - We've finished some constituent, A , that started in column $l < j$. So for each rule in column j that has A after the dot: Advance the dot and add the result to the bottom of column j .
- Output “yes” just if last column has **ROOT** \rightarrow **S .**
- **NOTE: Don't add an entry to a column if it's already there!**

Summary of the Algorithm

- Process all hypotheses one at a time in order. (Current hypothesis is shown in blue.)
- This may add **new hypotheses** to the end of the to-do list, or try to add **old hypotheses** again.
- Process a hypothesis according to what follows the dot:
 - If a word, **scan** input and see if it matches
 - If a nonterminal, **predict** ways to match it
 - (we'll predict blindly, but could reduce # of predictions by *looking ahead* k symbols in the input and only making predictions that are compatible with this limited *right context*)
 - If nothing, then we have a complete constituent, so **attach** it to all its customers

A Grammar

S \rightarrow NP VP

NP \rightarrow Det N

NP \rightarrow NP PP

VP \rightarrow V NP

VP \rightarrow VP PP

PP \rightarrow P NP

NP \rightarrow Papa

N \rightarrow caviar

N \rightarrow spoon

V \rightarrow ate

P \rightarrow with

Det \rightarrow the

Det \rightarrow a

An Input Sentence

Papa ate the caviar with a spoon.

| 0 Det . a | 1 V . ate | 2 Det . a | | 4 PP . P NP | | 7 PP . P NP | | | | |
| | 1 P . with | | | 0 ROOT S . | | 1 VP V NP . | | | | |
| | | | | 4 P . with | | 2 NP NP . PP | | | | |
| | | | | | | 0 S NP VP . | | | | |
| | | | | | | 1 VP VP . PP | | | | |
| | | | | | | 7 P . with | | | | |
| | | | | | | 0 ROOT S . | | | | |
| | | | | | | | | | | |

completed that VP = VP PP in col 7
col 1 would let us use *it* in a VP PP structure
can reuse col 1 as often as we need

How to change the parser into a recognizer?

What's the Complexity?

What's the Complexity?

- How many state sets will there be?
 - Length of sentence, n
- How big can the state sets get?
 - Size of grammar, G , times n
- How long does it take to build a state set?
 - Scan
 - Constant time
 - Predict
 - Need to check for duplicates
 - Complete
 - Search previous state set, also check for duplicates, $(Gn)^2$
- Total: $O(n^3)$
